Excited for his first session of the summer, Mr. Hudecek accidentally locked himself in the chamber without checking his supplies. Checking his gauges, he found 37.38 grams of sugar and 42.79 liters of pure oxygen were available (assume oxygen density $=1.429 \mathrm{~g} / \mathrm{L}$ ). Strangely, Mr. Hudecek knows that to survive a week in the chamber, his body must produce a minimum of 1.30 moles of carbon dioxide from the combustion of his dietary sugar. Immediately, he began calculations to determine whether there was any chance of survival. Is his teaching career over? Does he survive this ordeal? Please, help Mr. Hudecek calculate his fate.
